6. To create an html page with different types of frames such as floating frame, navigation frame & mixed frame.

a) Create an html page named as "mixedframe.html". Divide the page into two columns of 25% & 75% size. In 25% display the image and divide the 75% into two rows. (50% & 50%). In the first 50% display the video file, and other 50% the time table created

CODE:

Mixedframe.html:

```
<!DOCTYPE html>
<html>
<head>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1">

  <frameset cols="25%,75%">

    <frame name = "left" src = "image.jpeg" />
    <frameset rows="50%,50%">
      <frame name="righttop" src="video.mp4"></frame>
      <frame name="rightbottom" src="timetable.html"></frame>
    </frameset>

  </frameset>

</html>
```

Timetable.html:

```
<!DOCTYPE html>
<html>

10. Design the following static web pages required for an online book store web site.

1) home page:

The static home page must contain three frames.

Top frame: Logo and the college name and links to Home page, Login page, Registration page, catalogue page and Cart page (the description of these pages will be given below).

Left frame: At least four links for navigation, which will display the catalogue of respective links.

Right frame: The pages to the links in the left frame must be loaded here. Initially this page contains description of the web site

12. You will create several files related to a recipe web site for a fictional pie company named

Granny's Pies. You need to turn in the following files:

- index.html, the first of two web pages (with an optional CSS style sheet file)
- pie.html, the second of two web pages
- recipe.css, the style sheet for pie.html

The first part of your task is to create a front page (README) for this web site, stored in a file

named index.html. Your front page must contain a link to pie.html. The file must also be at least 20

lines long and must contain at least 4 different XHTML elements in its body. It also may not significantly borrow content from your pie.html. Otherwise, this front page can have any appearance you like. If you like, you may use an optional CSS style sheet with this page named index.css and submit it with your other files.

The second (and more substantial) part of the assignment is to recreate a specific web page describing a recipe for lemon meringue pie, stored in a file named pie.html. Unlike index.html, this

page is rigidly specified and must exactly match the appearance specified in this document.

For full credit, your files must be uploaded to our web server and must match several stylistic

guidelines, all specified in the following sections.

15. Develop a JavaScript program that will determine the gross pay for each of three employees.

The company pays "straight time" for the first 40 hours worked by each employee and pays "time and a half" for all hours worked in excess of 40 hours. You are given a list of the employees of the company, the number of hours each employee worked last week and the hourly rate of each employee. Your program should input this information for each employee, determine the employee's gross pay and output XHTML text that displays the employee's gross pay. Use prompt dialogs to input the data.

18. Write a Javascript code block, which validates a username and password against hard coded values.

If either the name or password field is not entered, display an error message showing:

“You forget one of the required fields. Please try again.”

In case, the fields entered do not match the hard coded values, display an error message showing:

“Please enter a valid username or password”

If the fields entered match, display the following message: “Welcome (username)”.
